WHAT IS A CALORIE

A calorie is a unit of measurement. Specifically, it is defined as the amount of heat needed to raise the temperature of one gram of water by one degree Celsius.

The foods we eat supply our bodies with calories, providing the energy we need to live and stay healthy

To maintain a stable weight, the energy we put into our bodies must be the same as the energy we use through normal bodily functions and physical activity.

An important part of a healthy diet is balancing the energy you put into your bodies with the energy you use.

For example, the more physical activity we do, the more energy we use.

ENERGY BALANCE

Energy balance depends on what your goal is, whether that is weight loss or weight gain.

If we eat in a calorie deficit for a certain period of time, we will lose weight. If we eat in a calorie surplus over a period of time, we will gain weight.

This is why tracking calories is so important for our goals.

Now, this will vary depending on the person: your age, your activity levels, your metabolism amongst other bits.

This is why a proven given formula to work out your ideal macro and calorie targets is important when training towards a given goal.

NUTRITIONAL FORMULA:

BW (KG) X 22 (FEMALES)
BW (KG) X 24 (MALES)

BMR = BASAL METABOLIC RATE (CALORIE EXPENDED AT REST)

Physical Activity Levels (PAL)

1.1 TO 1.9

1.1 = SEDENTARY

1.9 = VERY ACTIVE

BMR X PAL

E.G 2000 X 1.4 = 2800 CALORIES (TDEE) Maintenance calories

20% FOR SURPLUS OR DEFICIT

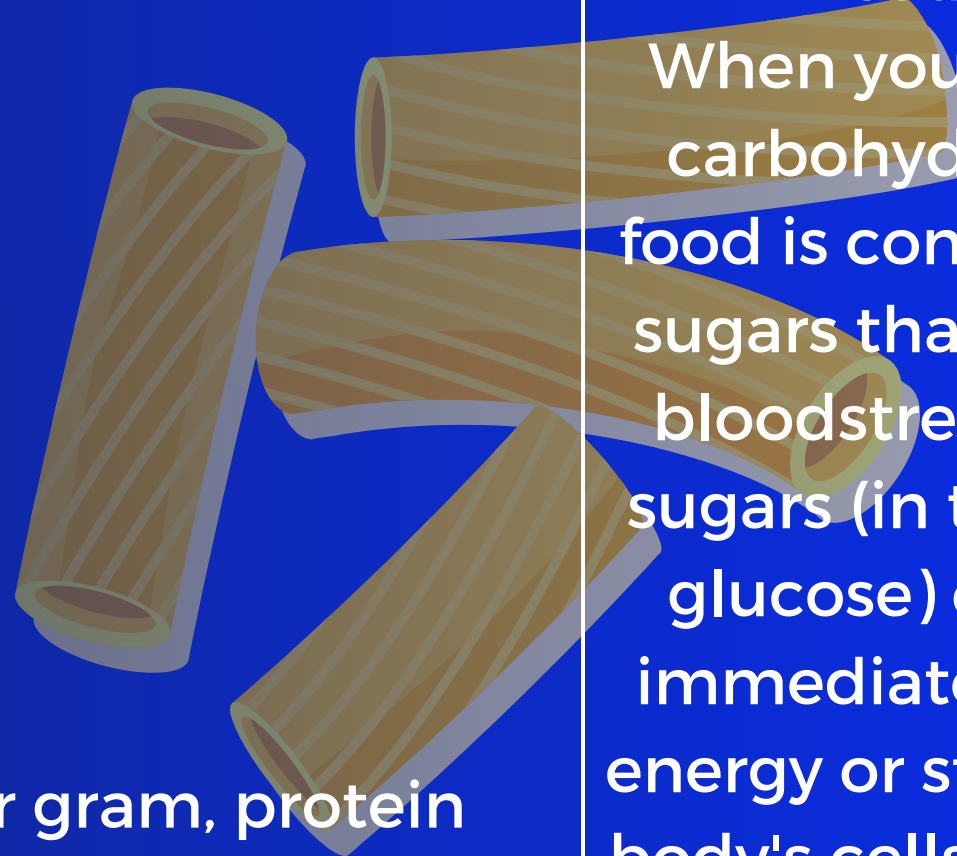

03

MACRO'S & CALS

Carbohydrates provide 4 calories per gram, protein provides 4 calories per gram, and fat provides 9 calories per gram.

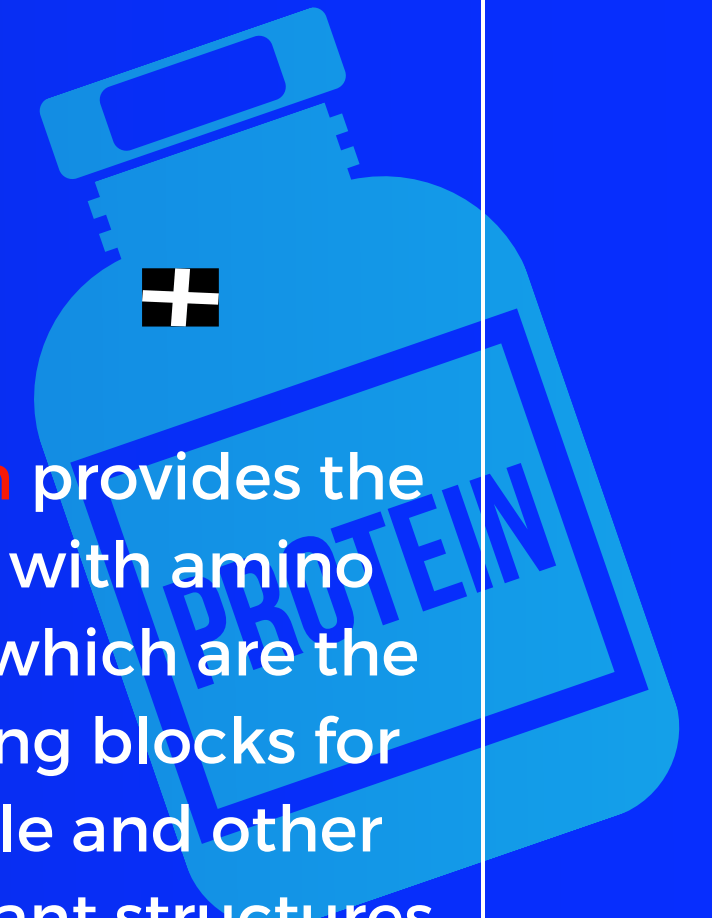

These are the main nutrients we need daily to keep our bodies going, and I could go into extreme details about each of them but for this sake I will provide a simple reference for each.

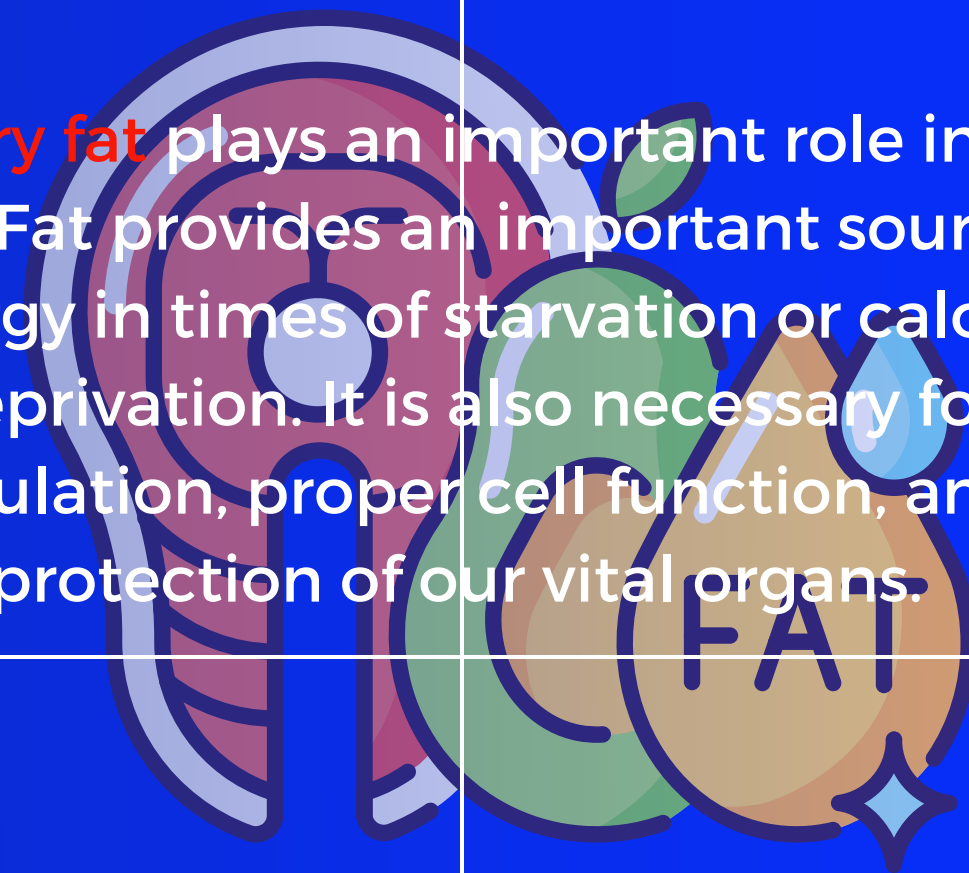

Carbohydrates are the body's preferred fuel source.

When you consume carbohydrates, the food is converted into sugars that enter the bloodstream. These sugars (in the form of glucose) can be an immediate source of energy or stored in the body's cells to be used at another time

Protein provides the body with amino acids, which are the building blocks for muscle and other important structures such as the brain, nervous system, blood, skin, and hair

dietary fat plays an important role in the body. Fat provides an important source of energy in times of starvation or caloric deprivation. It is also necessary for insulation, proper cell function, and protection of our vital organs.

MANAGING CALORIES

The simple way to manage your calories is to track your input (NOT YOUR OUTPUT).

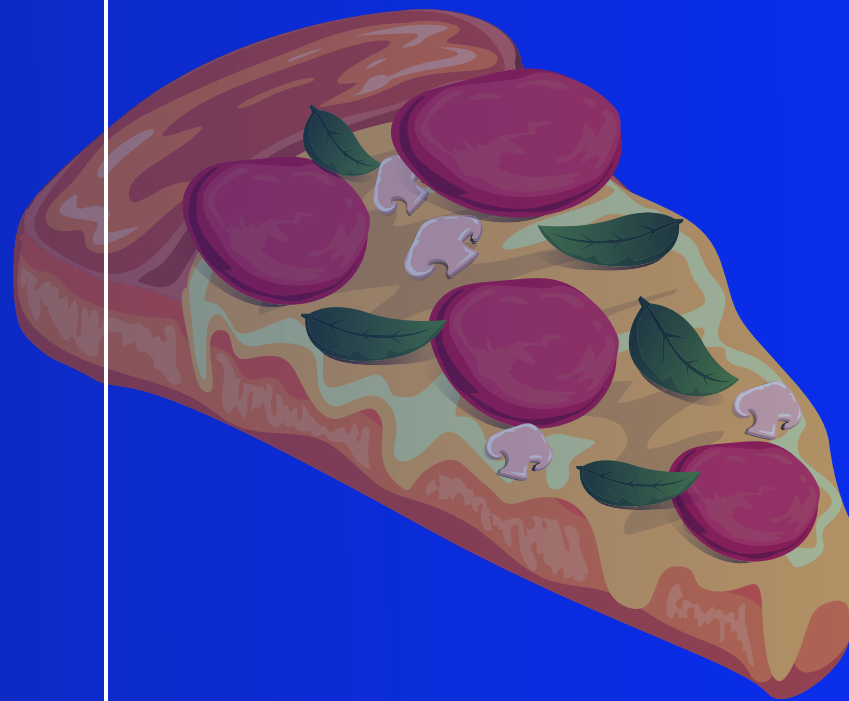

If you track your output, this is when you start to see people eating back what they think they have burnt of during exercise (which is probably false anyway).

Now, if we hit our calorie goals over a certain period of time we will see results.

However, this seems to be a BIG issue when it comes to the weekend for an everyday human.

This isn't a bad thing! It's just how we go about managing it so we can still enjoy our foods, have a drink or two and still get results!

IT IS POSSIBLE!!
