

SUPPORT GUIDE

A brief overview of pre bed routines, warm up & cool downs routines and supplement advice.

This will allow you to get the most out your training by being able to manage the external factors that surround it.

PRE BED ROUTINES

Tips: Reduce blue light intake, minimise work beyond 6pm, evening chill out, go alarm free when possible, get outside & reduce social media intake!

A brief overview would simply be to help you maintain homestasis and recovery as soon and as effective as possible.

We also want to release melatonin (sleep hormone) in a chill out zone, to allow us to have a better sleep. More sleep means more time to recover and also a more stable and positive mental state.

By reducing blue light and social media, we allow our brain to relax. The brain will not be relaxed with taking in content and blue light, do this to improve sleep!

WARM UP/COOL DOWN ROUTINES

Warm up benefits include raising body temp, reduce risk of injury, increase blood flow, prepare mentally for exercise and allow for better performance.

Exercises to perform: Arm to toe stretch, lunges, arm circles, jumping jacks, upper body twist, hanging lat raise. For a more cardio based warm up - bike, walk or row for 5-10 mins

Cool down benefits include reduce heart rate, prevent injury, reduce DOMS.

Exercises to perform: Any foam roller exercises, side lunge, calf stretch, across arm stretch, arm to sky reach, quadricep stretch, side lateral bend.

SUPPLEMENT ADVICE

Vitamin D3: Sunlight is the main giver of Vitamin D, which is responsible for Bone Health and Structure.

Multicomplex Vitamins: A good Multivitamin should take care of atleast 50% of the recommended intake for each Vitamin and Mineral necessary for Health and Function.

Omega 3: Allows for better joint maintenance, especially for those who don't get enough fish in their diet.

Whey Protein: high quality whey protein / isolate will allow you to hit the intake per day and enhance the recovery and performance of muscle growth and repair.
